

Example Report 2

This is a placeholder for your second report page, demonstrating how multiple pages work together in an Observable Framework site.

Overview

This page shows how you can structure multi-page documentation or report sites. Each page in the `src/` directory becomes a route in your published site.

Data Integration

You can load data from various sources:

- CSV, JSON, or other data files
- Database queries
- API endpoints
- Data loaders written in any language

Observable Framework's data loader system makes it easy to work with data from anywhere.

Collaboration

Observable Framework sites are just markdown files and code, which means:

- Easy version control with Git
- Straightforward collaboration workflows
- Simple deployment to static hosting
- PDF export for sharing offline

Replace this placeholder content with your own analysis, visualizations, and findings.
